If for k we write k + Ki + ij, it is clear that by proper choice of K, fi we can get rid of the two middle terms of (- J)3 h-e equation then becomes ijk + oi3 + ftj3 = 0, which is the same as p--a cos 38, where p is the distance of a tangent from the origin k = 0, and 8 the angle it makes with a fixed line. (salmon, Higher Plane Curves, p. 271, Ex. 5.) This result is true if the line infinity is an ordinary tangent at eaeh of the circular points. Now this holds good in the first case of the question; for in this the one variable point at infinity is made to move up to a multiple point, and so only one branch acquires an ordinary contact; in virtue of this, then, the line infinity counts only once as an asymptote for each circular point. It also holds good in the already well-known case of curves of the s3cond order, -. e., in the second case of the question when n = 0. For in this only the two variable points at infinity coincide at a circular point, making again an ordinary contact. But in the second case of the question, when n is not zero, something different happens. Here the two variable points at infinity simultaneously approach...
